VICON

Valerus 24.1 Offers the Optimal Experience for Desktop Client Users

All of the features our Valerus thin client users have come to know and love are now available in the Valerus desktop client! Plus, the Valerus 24.1 release includes an exciting new integration with Aureus Insight Face Recognition.
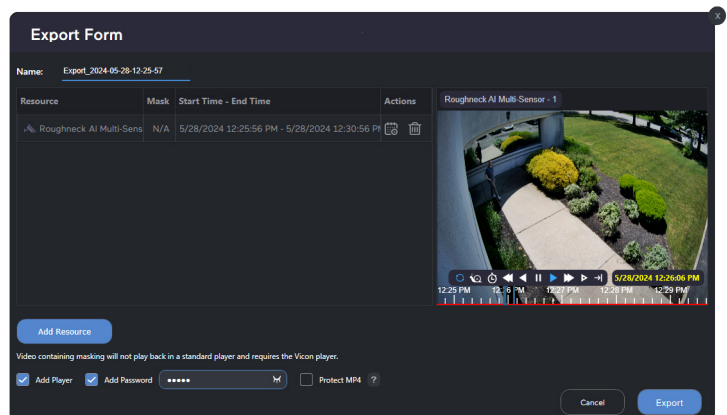

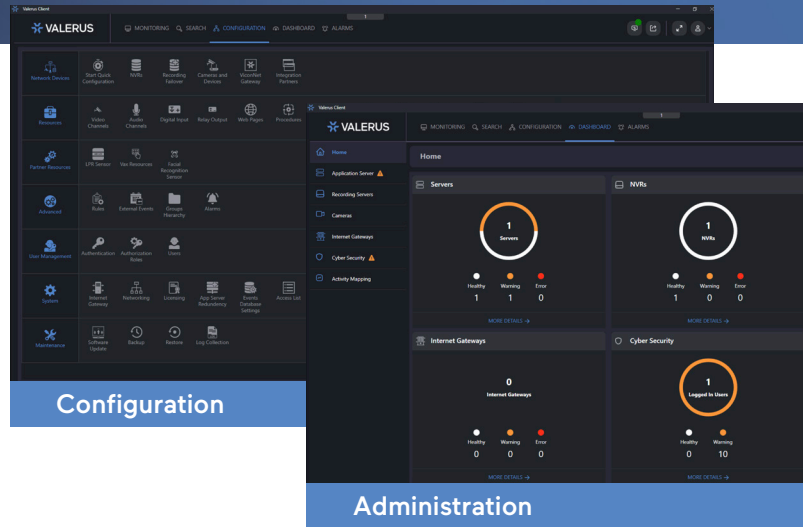

Thin Client and Desktop Client Feature Parity

That's right! Feature parity between the Valerus thin and desktop clients. So regardless of which platform you're using, you'll get the exact same framework, features, and functionality.

- **Configuration and Dashboard tabs included!** Perform configuration and admin tasks directly from the desktop client—no more toggling just to check your dashboards.

- **Export video via the new standalone player.** The player is no longer browser-based so it's no longer dependent on Internet Explorer. Just double-click the player icon and you're good to go on any platform running Windows 10 and above.

  As always, you have the option to password protect the export, and you can prevent users from editing or playing the export as well as the native file.

New Face Recognition Integration

Vicon has partnered with **CyberExtruder**, whose "face finding & matching" solution—Aureus Insight—now integrates with Valerus (ENT tier).
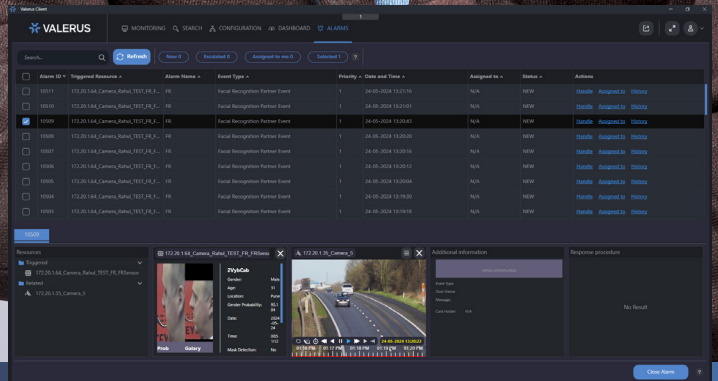

Similar to our integrations with Omnilert and Halo, a facial recognition event detected within Aureus will trigger a real-time alarm in Valerus, essentially giving you eyes on the scene so you can respond accordingly.

Benefits include:

- Situational awareness (understanding who is in your building...and should they be?)

- Real-time notification when a person of interest enters the building

- The ability to quickly locate individuals within the building

- Tools to search based on faces and facial characteristics

Vicon is committed to rolling out new integrations to meet your unique needs.

Essentially these disparate applications—like gun detection, vape and air quality detection, aggression detection, and now face recognition—all trigger alarms based on their own conditions and inputs, generating a lot of mission-critical data points in their own systems. Valerus is what pulls it all together and presents it via a unified UI, on a single alarm panel AND integrates the video piece so you can visually verify what's going on.
